## Task: Stock Damage Page Development

Develop the “Stock Damage” page using ASP.Net, HTML, and Bootstrap, JQuery, and C #as server-side programming language with MS SQL Server as the database.

### Requirements and Steps

1. Create a new database table named **\*\*Godown\*\*** with the following fields:

- GodownNo
- GodownName
- AutoSlNo

Insert two manual entries into this table. These entries must be loaded into the **\*\*Warehouse Name\*\*** dropdown on the Stock Damage page.

2. Create another database table named **\*\*SubItemCode\*\*** with the following fields:

- AutoSlNo
- SubItemCode
- SubItemName
- Unit
- Weight
- (Additional fields as needed)

In the **Item Name** dropdown, load all items from the SubItemCode table. When a user selects an item name, the **Item Code** and **Unit** fields should auto-populate based on that item.

3. The **Stock** field should display data from the **Stock** table based on the selected SubItemCode. The Stock table contains SubItemCode and Stock quantity information.

4. The **Batch No** field will be set to "NA" by default.

5. The **Currency** dropdown should be loaded from the **Currency** table with the following fields:

- - CurrencyName
- - ConversionRate

Based on the selected currency, the exchange rate will automatically display in the related field.

6. The user will input the following:

- - Quantity
- - Rate
- - Amount In

7. The **Dr A/C Head** field will be set by default to "Stock Damage".

8. The **Employee Name** dropdown will load data from the **Employee** table.

9. The **Comments** field will accept free text input from the user.

10. When the user clicks the **Add** button, the data entry should appear in a temporary Bootstrap table below. The data should not be saved to the database at this stage. The user can add multiple entries.

11. When the user clicks the **Save** button, all added entries will be saved into the **Stock Damage** table in the database. Use a stored procedure for saving, and the stored procedure name will be **SP\_TableName\_Save**.

## Technology Stack

- ASP.Net (Frontend and Server-Side Logic)
- HTML, Bootstrap, JQuery (Client-Side)
- C# (Server-Side)
- MS SQL Server (Database)
